## CONTINUAL LEARNING IN NEURAL NETWORKS: ON CATASTROPHIC FORGETTING AND BEYOND

Polina Kirichenko

**New York University** 

#### **PLAN**

- Continual learning & catastrophic forgetting
- Alleviating forgetting
  - Replay
  - Regularization
  - Expansion
- Learning continually with invertible models [if we have enough time]

## **CONTINUAL LEARNING (CL)**

- A model is presented with a sequence of tasks  $T_{t_1}, T_{t_2}, \ldots, T_{t_{ au}}$  with task IDs  $t_i \in \{1, \ldots, M\}$
- When training on task  $T_i = \{(x_j^i, y_j^i)\}_{j=1}^{N_i}$  we don't have access to previous data
- The assumption is that the tasks will be revisited in the future
- Catastrophic forgetting: model's performance on previous task degrades when training on new one

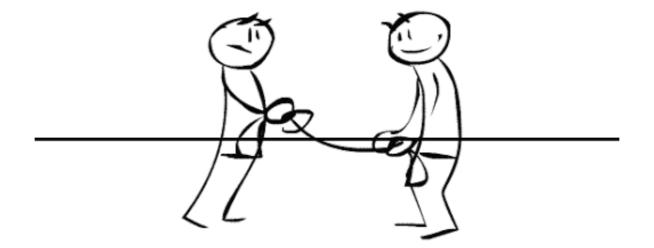

### **GOALS**

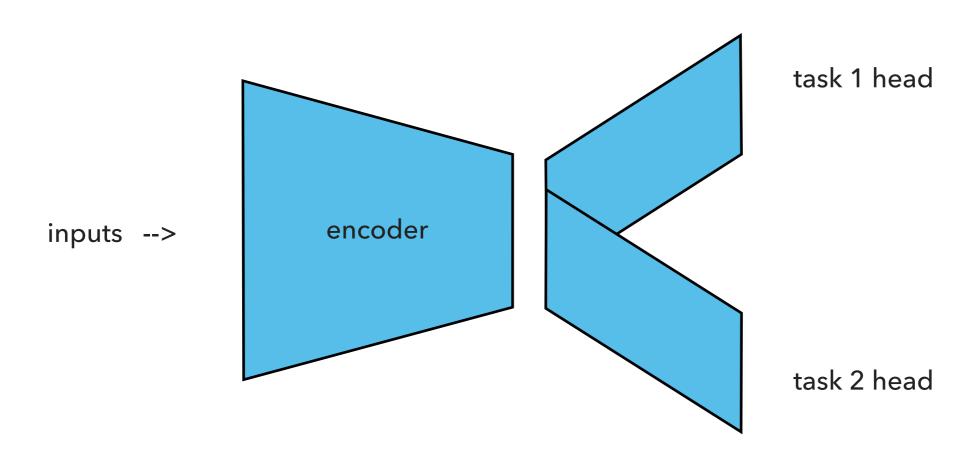

- Mitigate forgetting
- Transfer knowledge to new and old tasks
- Fixed or limited memory and computation (scalability)

### CONTINUAL LEARNING: CATASTROPHIC FORGETTING

- Tug-of-war dynamics while learning on non iid distribution
- Problem of "locality" of learning and optimization
- Stability-plasticity tradeoff

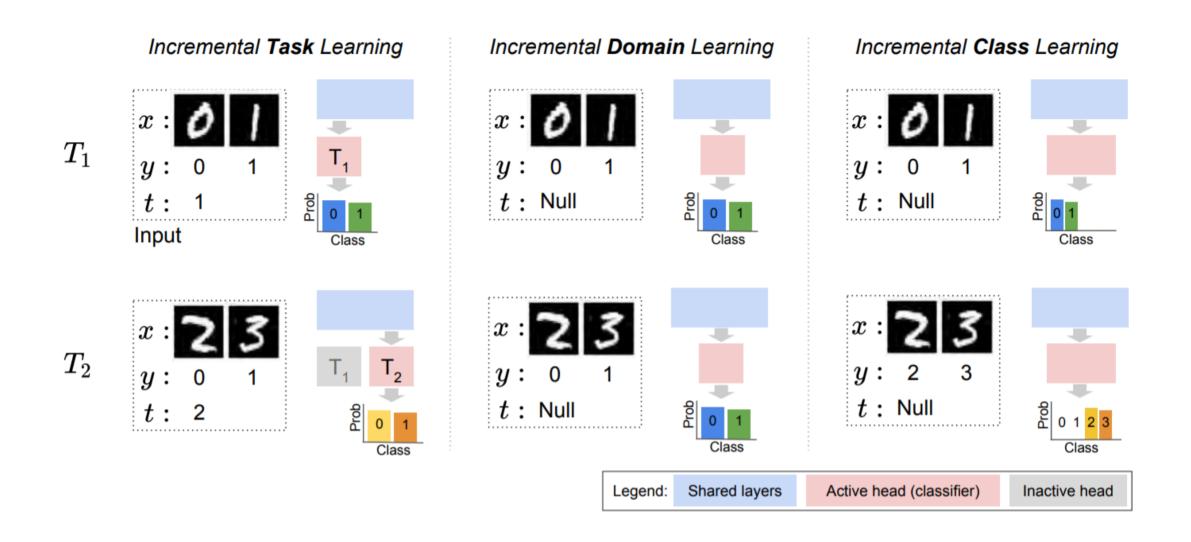

## CONTINUAL LEARNING NEURAL NETWORK

### CONTINUAL LEARNING SCENARIOS

Split MNIST task: T1 is classes 0 and 1, T2 is classes 2 and 3, ...

#### CONTINUAL LEARNING BENCHMARKS

- "Split" datasets: MNIST, CIFAR, ImageNet, CUB [Wah et al 2011]
- Permuted or rotated MNIST, SVHN-MNIST
- Taskonomy [Zamir et al 2018]

#### **METRICS**

Let  $a_{i,j}$  be the accuracy of the model on task i after training on task j

- Final test accuracy  $a_{i,\tau}$  on each task i or average across tasks  $\frac{1}{d}\sum_{i=1}^d a_{i,\tau}$
- Average forgetting  $\frac{1}{\tau-1}\sum_{i=1}^{\tau-1}(a_{i,i}-a_{i,\tau})$  (or backward transfer!)
- Forward transfer  $\frac{1}{\tau-1}\sum_{i=2}^{\tau-1}(a_{i,i-1}-r_i)$  [Lopez-Paz & Ranzato 2017]

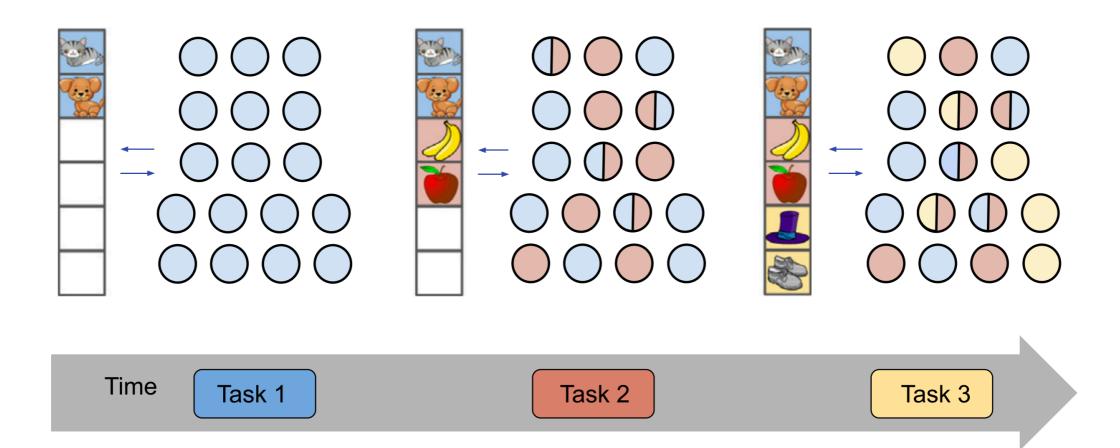

### ALLEVIATING CATASTROPHIC FORGETTING

- Replay based
- Regularization based (parameter and function space)
- Expansion based (adding capacity)
  - + their combination

#### Baselines:

- Upper bound: Multi-Task Learning (T1, T1+T2, ...) or iid training
- Lower bound: SGD (more common than adaptive optimizers in non iid tasks)

- Write task data to fixed size memory and use it later to prevent forgetting
- Need to choose: update rule using replay samples, sampling strategy to fill the replay buffer

Reservoir sampling / choosing samples uniformly at random

# Algorithm 1 Experience Replay for Continual Learning.

```
1: procedure ER(\mathcal{D}, mem\_sz, batch\_sz, lr)
            \mathcal{M} \leftarrow \{\} * \text{mem\_sz} \qquad \triangleright \text{Allocate memory buffer of size mem\_sz}
 3:
       n \leftarrow 0
                           Number of training examples seen in the continuum
            for t \in \{1, \cdots, T\} do
                   for B_n \overset{K}{\sim} \mathcal{D}_t do \triangleright Sample without replacement a mini-batch of
 5:
      size K from task t
                         B_{\mathcal{M}} \stackrel{K}{\sim} \mathcal{M}
                                                   Sample a mini-batch from \mathcal{M}
 6:
                         \theta \leftarrow SGD(B_n \cup B_{\mathcal{M}}, \theta, \operatorname{lr}) \triangleright \text{Single gradient step}
 7:
      to update the parameters by stacking current minibatch with minibatch from memory
                          \mathcal{M} \leftarrow \text{UpdateMemory}(\text{mem\_sz}, t, n, B_n)
 8:
      ▶ Memory update, see §4
                         n \leftarrow n + \text{batch\_sz}
 9:
                                                                                 return \theta, \mathcal{M}
10:
```

 Gradient Episodic Memory (GEM): we want the loss on memory samples to not increase

minimize<sub>\theta</sub> 
$$\ell(f_{\theta}(x,t),y)$$
  
subject to  $\ell(f_{\theta},\mathcal{M}_k) \leq \ell(f_{\theta}^{t-1},\mathcal{M}_k)$  for all  $k < t$ 

Project gradients:

$$\langle g, g_k \rangle := \left\langle \frac{\partial \ell(f_{\theta}(x, t), y)}{\partial \theta}, \frac{\partial \ell(f_{\theta}, \mathcal{M}_k)}{\partial \theta} \right\rangle \geq 0, \text{ for all } k < t.$$

$$\begin{aligned} & \text{minimize}_{\tilde{g}} \frac{1}{2} & \|g - \tilde{g}\|_2^2 \\ & \text{subject to} & \langle \tilde{g}, g_k \rangle \geq 0 \text{ for all } k < t \end{aligned}$$

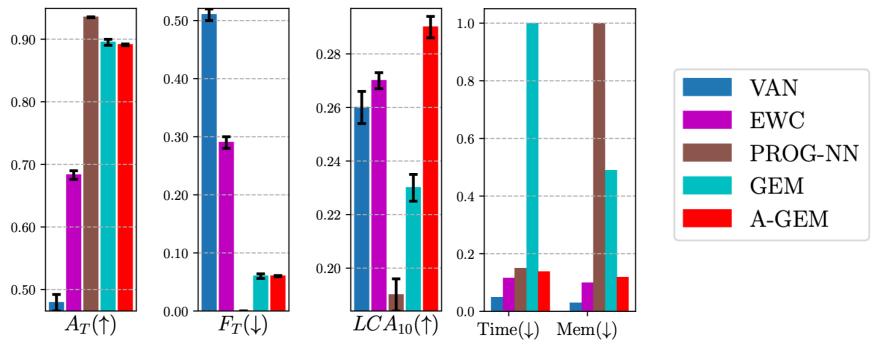

Averaged GEM: more memory efficient

$$\text{minimize}_{\tilde{g}} \quad \frac{1}{2}||g-\tilde{g}||_2^2 \quad \text{s.t.} \quad \tilde{g}^\top g_{ref} \geq 0$$

 $(\mathbf{x}_{ref}, y_{ref}) \sim \mathcal{M}$ 

Project gradients:

$$ilde{g} = g - rac{g^ op g_{ref}}{g^ op_{ref} g_{ref}} g_{ref}$$

(a) Permuted MNIST

### INCREMENTAL LEARNING

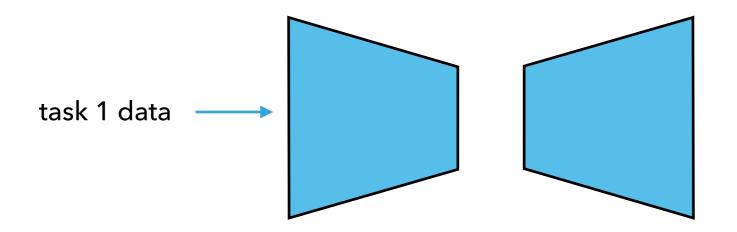

- Incremental Classifier and Representation Learning (iCaRL): classincremental learning setting
- Features extractor network  $\phi: \mathcal{X} o \mathbb{R}^d$
- For representation learning  $g_y(x) = 1/(1 + \exp(-w_y^T \phi(x)))$
- Exemplar set for each class  $P_t$  , classification is done via nearest mean of exemplar (class prototype)

$$\ell(\Theta) = -\sum_{(x_i,y_i)\in\mathcal{D}} \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right. \\ \left. + \sum_{y=1}^{s-1} q_i^y \log g_y(x_i) + (1-q_i^y) \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log(1-g_y(x_i)) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log g_y(x_i) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log g_y(x_i) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log g_y(x_i) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log g_y(x_i) \right] \\ = \left[ \sum_{y=s}^t \delta_{y=y_i} \log g_y(x_i) + \delta_{y\neq y_i} \log g_y(x_i) \right]$$

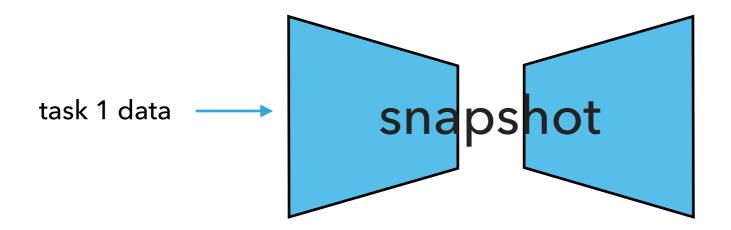

classification loss

distillation loss

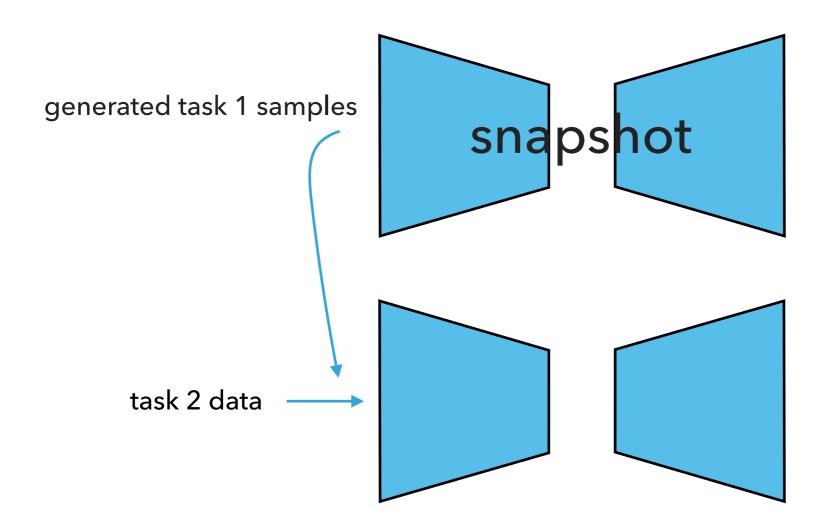

Continual Unsupervised Representation Learning [Rao et al 2019]

Continual Unsupervised Representation Learning

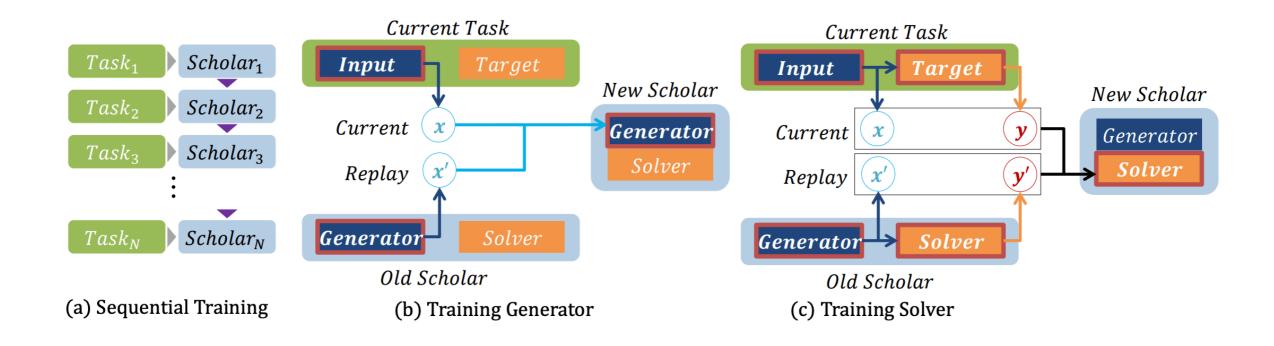

Continual Unsupervised Representation Learning

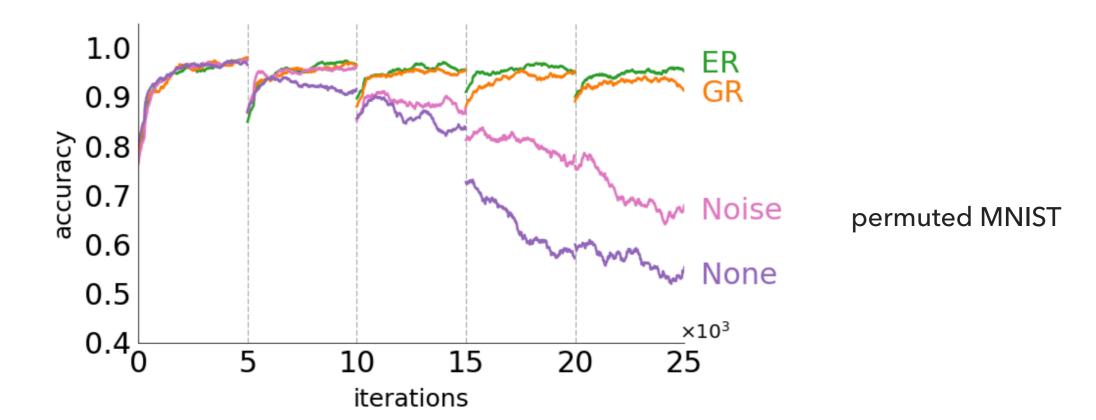

- Generative Adversarial Networks can be used to approximate evolving data distribution
- "Scholar" is a generator + task solver

$$L_{train}(\theta_i) = r \mathbb{E}_{(\boldsymbol{x}, \boldsymbol{y}) \sim D_i} [L(S(\boldsymbol{x}; \theta_i), \boldsymbol{y})] + (1 - r) \mathbb{E}_{\boldsymbol{x}' \sim G_{i-1}} [L(S(\boldsymbol{x}'; \theta_i), S(\boldsymbol{x}'; \theta_{i-1}))]$$

- Generative Adversarial Networks can be used to approximate evolving data distribution
- "Scholar" is a generator + task solver

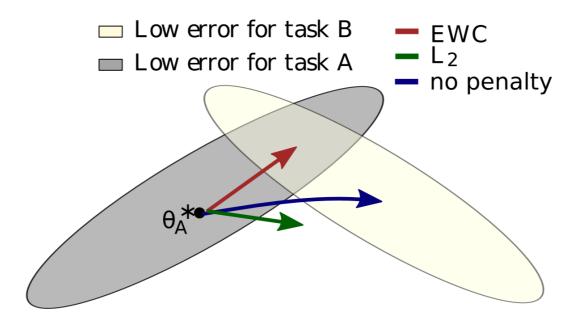

$$L_{train}(\theta_i) = r \mathbb{E}_{(\boldsymbol{x}, \boldsymbol{y}) \sim D_i} [L(S(\boldsymbol{x}; \theta_i), \boldsymbol{y})] + (1 - r) \mathbb{E}_{\boldsymbol{x}' \sim G_{i-1}} [L(S(\boldsymbol{x}'; \theta_i), S(\boldsymbol{x}'; \theta_{i-1}))]$$

### REGULARIZATION IN PARAMETER SPACE

L2 regularization  $\sum_{i=1}^{\iota} \alpha \|\theta - \theta_i^*\|^2$ 

Estimate the importance of each parameter for previous tasks and penalize changes to each parameter proportional to this measure

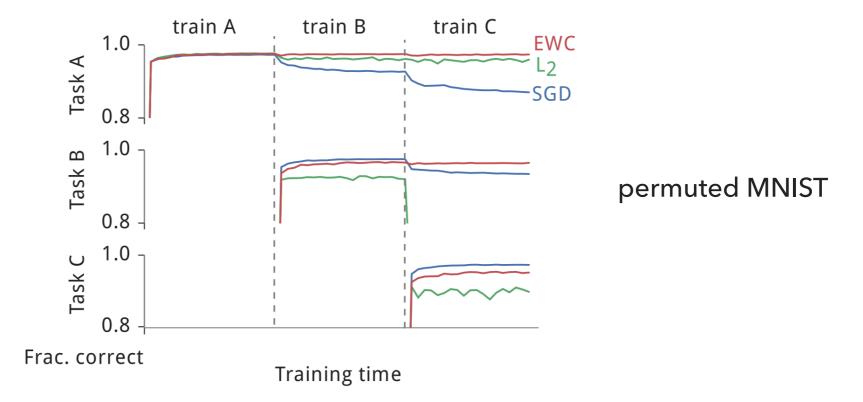

#### REGULARIZATION IN PARAMETER SPACE

Elastic Weight Consolidation (EWC)

$$\mathcal{L}(\theta) = \mathcal{L}_B(\theta) + \sum_{i} \frac{\lambda}{2} F_i (\theta_i - \theta_{A,i}^*)^2$$

where  $F_i$  is a diagonal of the Fisher information matrix F

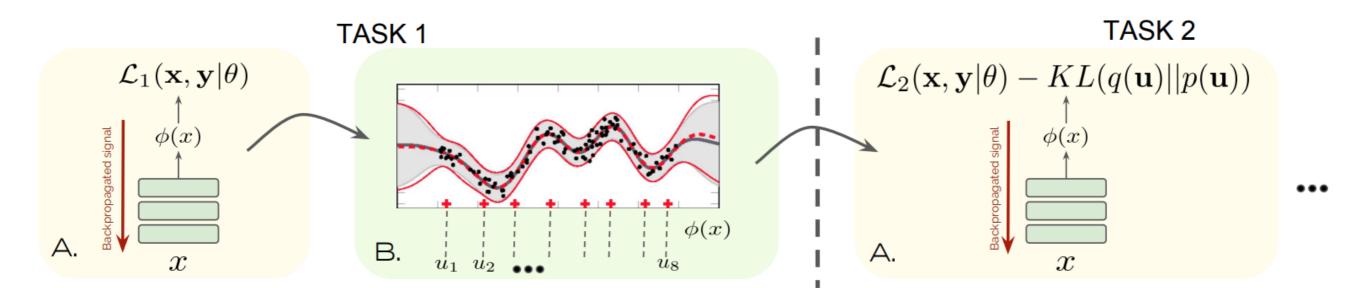

### REGULARIZATION IN PARAMETER SPACE

EWC Bayesian interpretation:

$$\log p(\theta|\mathcal{D}) = \log p(\mathcal{D}_B|\theta) + \log p(\theta|\mathcal{D}_A) - \log p(\mathcal{D}_B)$$

^ Approximate posterior as a Gaussian distribution with mean  $\, \theta_A^* \,$  and diagonal precision F

#### FUNCTIONAL REGULARIZATION FOR CONTINUAL LEARNING WITH GPS

Replace the last layer of a neural network with a GP

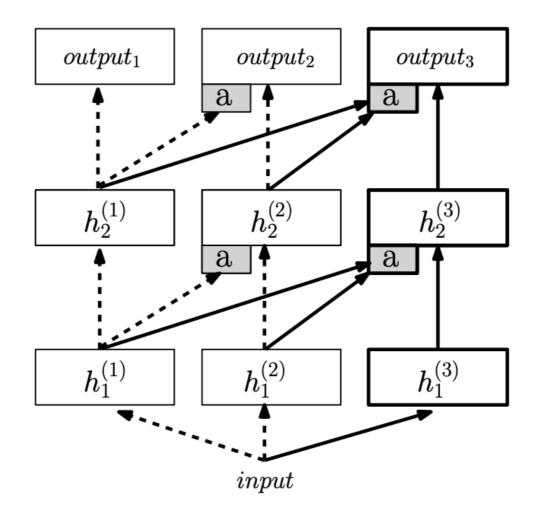

$$f_i(x; w_i) \equiv f_i(x; w_i, \theta) = w_i^{\top} \phi(x; \theta),$$
  
$$f_i(x) \sim \mathcal{GP}(0, k(x, x')), \ k(x, x') = \sigma_w^2 \phi(x; \theta)^{\top} \phi(x'; \theta),$$

Use inducing points to avoid forgetting with the GP

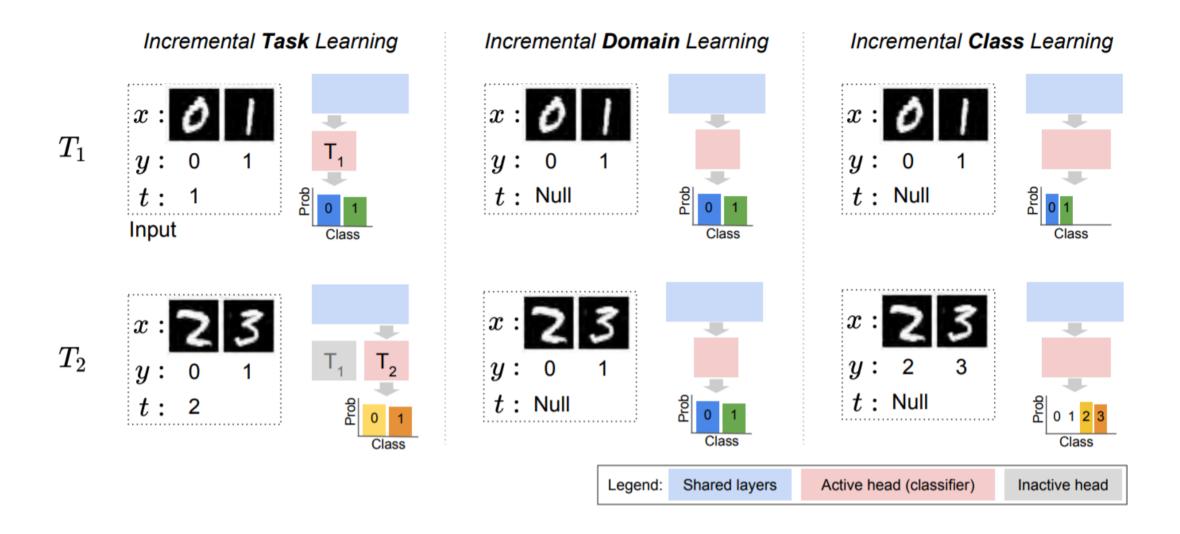

### **EXPANSION**

Progressive Neural Networks

$$h_i^{(k)} = f\left(W_i^{(k)} h_{i-1}^{(k)} + \sum_{j < k} U_i^{(k:j)} h_{i-1}^{(j)}\right)$$

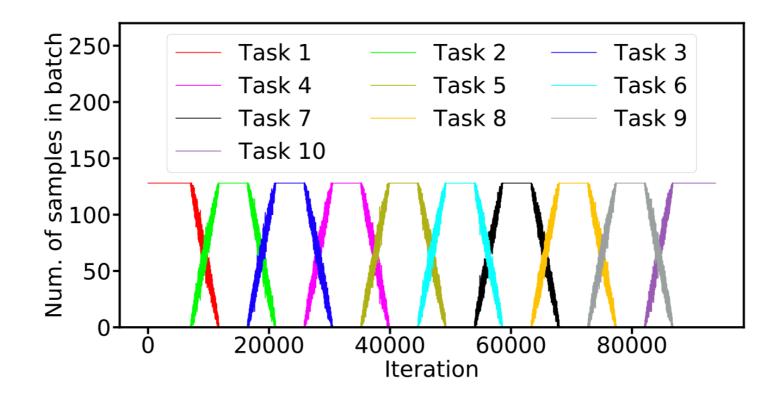

### **CONTINUAL LEARNING SCENARIOS**

### CONTINUAL LEARNING SCENARIOS

- Typically the input is  $(x_i,y_i,t_i)$  but the model may not have access to task ID and only receive  $(x_i,y_i)$
- Task agnostic domain incremental learning or unsupervised learning
- Task free: continuously drifting distribution (e.g. CIFAR-C with increasing noise intensity or mixed tasks)

### BEYOND CATASTROPHIC FORGETTING

- Forward and backward transfer
- Sample efficiency: the minimum possible number of examples to replay for remembering
- Understanding continual learning and forgetting [Ramasesh et al 2020, Mirzadeh et al 2020]
